Upon debating electricity's future, there are numerous thoughts that come to mind. Here is a preview to such thoughts.

Wireless electricity!

How wonderful will it be if every house is connected by wireless electricity, no wiring at all? Can such an imagination come true? As per industry experts wireless electricity will become a reality. In 2007, a Massachusetts Institute of Technology team successfully undertook an experiment for wireless electricity. This dream is not a distant one thanks to the success garnered through experiments for wireless electricity. Some time soon it will be seen that electrical appliances are getting charged automatically via air!

Complete control bestowed upon consumers!

According to experts in the industry, you shall not have to rely on the electricity sector for your power requirements but on yourself only. You will have the final say on which way the power reaches your desired destination. It will not be mandatory for you to pay the minimum bill amount while you are globe trotting. If experts are to be believed then consumers will have various controlling options over a period of time. But what is not known as of now is that when this future shall arrive, 10, 20 or 50 years, but surely this is what the future holds for consumers with this kind of controls.

Clean electrical energy!

Are you aware of the fact that the left over from electricity production emit humungous sums of carbon dioxide into the environment? A school of thought dreams of future electricity being clean & green. With environmental issues coming to the forefront, future electricity production shall be produced using renewable energy resources, creating a clean environment for all. As of today, production of electricity is taking place by burning fuels which are gradually becoming extinct.

Will everything be electric!

We have witnessed electric shavers and electric cars too, so what does the future hold for us? Electric shoes as footwear! Glasses, toothbrushes, combs, watches and apparels too might be available in the form of electrical gadgets. Cannot believe what you read, well then just visit the futuristic stores at Akihabara in Japan and look at what the future has to offer.

Outages, a thing of the past!

You as consumers can have a future wherein there won't be any power outages at all. All thanks to alternating power systems that promise to bring a time where there will be uninterrupted power supply. Our lifestyles have led us to rely on power for all our needs, thus uninterrupted power supply is a basic requirement. {mosgoogle align Green Content}
